SUMMARY

Build a web application Construction Warehouse & Procurement Management System for a construction company to manage central warehouse, project/site warehouses, item requests, procurement/PO, goods receiving, item usage, procurement payment administration, and Owner monitoring in one integrated system with one centralized database and real-time role-based access.

PROJECTS

Construction Warehouse & Procurement Management System | Integrated enterprise web system for warehouse, project inventory, procurement, PO, receiving, payment administration, notifications, audit trail, and reporting.

- Single integrated system with centralized database and real-time monitoring by role (Owner, Admin Gudang Pusat, Admin Gudang Proyek/Lapangan, Admin PO).
- Core workflow: request barang → stock check → warehouse fulfillment or procurement path → PO → receiving → delivery → project receiving → completed.
- Supports multi-warehouse inventory (central + multiple project warehouses) with separated stock per warehouse and transaction-based stock mutation.
- Implements procurement kroscek, vendor management, purchase order lifecycle, goods receipt, and staged payment administration (non-payment gateway).
- Provides dashboards per role with KPI cards, charts, activity feeds, status monitoring, low stock alerts, and project overview.
- Includes notification center (read/unread), audit trail/activity logs, detailed transaction timeline, and filtered/exportable reports (PDF/Excel if needed).
- Applies business rules: no stock change without inventory transaction, role-restricted access, request/PO/payment constraints, and consistent relational workflow.
- Security requirements include authentication, authorization (RBAC), CSRF, validation, secure upload, SQL injection/XSS protection, password hashing, session security, and backend authorization checks.
- Responsive UI/UX across desktop, tablet, and mobile with modern professional construction-corporate design system.
- Implementation planned in phased delivery from auth and master data through inventory, request workflow, procurement, receiving, usage/return, payments, notifications, reports, and hardening/testing.

ROLE & ACCESS SCOPE

Owner: monitoring all modules and reports. Admin Gudang Pusat: central inventory operations and request fulfillment. Admin Gudang Proyek/Lapangan: project warehouse stock, requests, receiving, usage, returns. Admin PO/Pengadaan: procurement workflow, vendor, PO, invoice, payment administration.

MINIMUM DATABASE ENTITIES

users, roles, projects, warehouses, categories, units, products, inventory, inventory_transactions, stock_opnames, requests, request_items, procurement_requests, procurement_request_items, vendors, purchase_orders, purchase_order_items, goods_receipts, goods_receipt_items, payments, payment_items, product_usages, returns, return_items, notifications, activity_logs.

KEY BUSINESS RULE EMPHASIS

Prioritize BUSINESS WORKFLOW → DATABASE RELATION → BACKEND LOGIC → UI. Avoid isolated CRUD-only implementation; ensure every transaction consistently updates related modules, statuses, notifications, and logs.
